If we now want to predict whether a The Hidden Layer studying 25 hours and having 70 marks in the mid term will pass the final term, we go through the forward propagation step and find the output probabilities for Pass and Fail.

The following script executes in the second phase of the back-propagation. The procedure of how input values are forward propagated into the hidden layer, and then from hidden layer to the output is the same as in Graph 1. Ask Question.

The gist was: She is designing for regression, not pattern recognition. Hope contains multiple neurons nodes arranged in layers.
